Chest CT report

Example report written for this demo. Not a real patient.

Fictional age and history written for this demo.

Example patient P · LIDC-IDRI-0556

Clinical information

62-year-old woman. CT chest. Coughing up a small amount of blood.

Former smoker, quit 5 years ago. No known cancer.

Technique

Axial CT of the chest without intravenous contrast, 2 mm slices.

No prior imaging is available for comparison.

Findings

Chest wall and bones

No acute rib fracture is seen.

The sternum and the visualised thoracic spine are intact.

The soft tissues of the chest wall are unremarkable.

Heart and vessels

The heart is normal in size.

There is no pericardial effusion.

The thoracic aorta is normal in calibre.

Mediastinum and hila

There is no mediastinal or hilar lymphadenopathy.

The oesophagus is unremarkable.

Airways

The trachea and main bronchi are patent.

Lungs and pleura

The lungs are well expanded.

There is no consolidation or pulmonary oedema.

There is no pneumothorax.

There is no pleural effusion.

However, a 9 mm solid nodule is seen in the right lower lobe.

No other pulmonary nodule is identified.

Upper abdomen

The visualised upper abdomen is unremarkable.

Impression

1. Pulmonary nodule, as described above.
